For premium photo album production

Premium photo albums typically use inkjet or dry lab printing methods. The prints are beautiful, but the paper used in these types of prints is difficult to handle in the finishing process.

Folding the photo prints straight along the traditionally made crease results often a skewed fold. Traditional creasers may also run the risk of damaging the printed image as the creasing knife is pressed into the image on the paper.

Fastbind Rollo™ is the ultimate creaser for high quality photo prints. Developed to the needs of premium photo album production, it creases any photo print, as well as includes positioning guides for easily creasing soft covers.

Safe creasing

Each inkjet or dry lab print is a significant investment. There really is no room for error during the finishing process. Fastbind Rollo™ has been developed to ensure creasing these valuable prints is reliable and safe. This is achieved through several new innovations (patents pending) that make Rollo™ a must-have.

Rollo™ makes a unique type of crease without damaging the print. And the crease properties are such that folding the print straight along the crease is much easier. This feature is highly appreciated by premium photo album makers.

Precise creasing

Rollo™ is a visual creaser. You can precisely position the print according to the printed image itself or creasing marks as desired. When the correct position is found, the paper is firmly secured into place with a clamp, eliminating risk of movement during creasing.

The edge of the crease bar on top is the actual line of the crease, but the creasing is done with a specially shaped roller from underneath the print, which helps ensure the printed image is not damaged in the process.

You can change creasing force according to material thickness. With this setting, you don't need to worry about how much force to apply. The creasing roller unit is moved back and forth along the creasing line, applying force evenly along the creasing line.
